

REEF.DEX · BLOCKDAG CHAIN 1404

Reef DEX: overview & testing brief

Reef is a live, permissionless token exchange on BlockDAG (chain 1404). **Invite-only testing runs until Wed Oct 7, 2026, 09:00 (UTC+7)**. From then Reef opens to the public as a **clearly labelled, unaudited beta**, alongside the \$REEF presale and airdrop.

What Reef DEX is

Reef (reef.dex) is a decentralized exchange where anyone can swap BlockDAG tokens or earn fees by supplying liquidity, with no sign-up and no middleman. It runs on the same automated-market-maker design as Uniswap V2: each pool holds two tokens, and prices move with supply and demand along a constant-product curve.

It is permissionless. Anyone can create a pool for any two tokens, and no one — including the team — can pause trading, freeze a pool or block a wallet. The site is live at reefdex.fyi.

What it can do today

Fees: every swap pays 0.30%. **0.25%** goes to liquidity providers and **0.05%** goes to Reef's treasury. This protocol fee has been **on since launch** (Sep 24, 2026). The only power over it is held by a 2-of-2 hardware-wallet multisig, so no single key can change it.

Feature	What it does
Swap	Trade any two tokens with a pool, including native BDAG (wrapped automatically as WBDAG)
Add / remove liquidity	Supply both tokens of a pool, earn a share of fees, withdraw any time
Create a pool	Anyone can list a new token pair and set its starting price
Slippage protection	A tolerance you set (default 0.5%) applies to swaps, adding and removing liquidity
Price-impact warnings	Large trades show the impact; very large ones need a second tap to confirm
Price chart and recent trades	Per-pool history read straight from the chain
24-hour TWAP oracle	A manipulation-resistant average price for the NOCAP/BDAG pool
LP-lock badge	Reads the NOCAP/BDAG lock live on-chain: 99.98% of pool liquidity locked until 25 Mar 2027 at last check
RPC status panel	12 public BlockDAG endpoints with live latency; a known forked endpoint is flagged and blocked
Explorer links	Every transaction links to its page on the BlockDAG explorer

\$REEF: Reef's own token

Full details: the \$REEF token page (and its PDF).

\$REEF is a thank-you to people who use Reef, plus a small presale whose **every BDAG goes into the REEF/BDAG pool**, locked for 12 months. It is not a governance token, pays no revenue share (the 0.05% protocol fee goes to Reef's treasury, not to holders), and carries no promise of value.

Supply	21,000,000 REEF, fixed no mint, no owner · token 0xb7a1e198767bf0fd4C1C3805b9757369e1c3F416
Presale	1,050,000 REEF at 150 BDAG max raise 157,500,000 BDAG · 2,500,000 BDAG per wallet
Sale window	Wed Oct 7 – Fri Nov 6, 2026, 09:00 UTC+7 02:00 UTC · or earlier if it sells out
Pool	Opens at 225 BDAG per REEF seeded by the presale contract; LP locked 365 days · unsold REEF to the dead address
Refund fallback	If the pool isn't launched within 7 days of close buyers refund in full after Fri Nov 13, 09:00 UTC+7
Airdrop	2,100,000 REEF, first 1,000 wallets Reef activity Oct 7 – Nov 6 · tiers 1 / 3 / 10 shares · claims close Feb 4, 2027
Rule until launch	No REEF leaves any team wallet tester rewards, airdrop and marketing all pay out after the pool is live

Security and testing

A thorough internal review; no independent professional audit. Everything below was done in-house.

Check	Result
Project test suite (9 tests)	9/9 pass on bytecode compiled with the exact deployment settings
Extra invariant checks (12)	12/12 pass: access control, fee maths, constant product (K) holds, minimum liquidity locked, full withdrawal
Manual code review	Reentrancy locks on every pool action; multisig marks a transaction executed before calling out; overflow checks built into Solidity 0.8
Static analysis (Slither 0.11.6)	Run Sep 30 on all Reef and \$REEF contracts: 59 findings, each reviewed; no real issues . All are standard Uniswap V2 patterns (lock-guarded pool calls, the timestamp price accumulator) or intended behaviour
\$REEF presale rehearsal	70/70 against Reef's real contracts with the real sale dates, including deliberate attacks. Found and fixed: anyone could block the pool launch for ~0.016 BDAG of gas and force refunds; the deployed version seeds the pool directly and is immune
\$REEF airdrop	11/11 end to end, including a 1,050-wallet run: exactly the first 1,000 qualified and all 1,000 claims succeeded
Chain compatibility	All \$REEF contracts compiled for Berlin, the EVM version Reef itself targets, and checked free of newer opcodes such as PUSH0
Live on-chain check	Factory, router, multisig, oracle and lock read directly from the chain and match expectations
LP lock	Found holding only 0.1% of liquidity; fixed — now 99.98%
Remove-liquidity slippage	Found sending "accept anything" minimums; fixed — now uses your slippage setting
Protocol-fee wording	Site described the fee switch as off; fixed Sep 30 to say it has been on since launch
Source verified on explorer	WBDAG, ReefPair and ReefAdminMultisig verified; Factory, Router and TWAP oracle blocked by explorer tooling, not by the code
Not done yet:	Independent audit by a professional security firm (Reef and \$REEF contracts)

Readiness

Now until Oct 7, 09:00

Invite-only testing with a small group, using amounts they can afford to lose.

From Oct 7: public beta

Reef and \$REEF open to everyone **without an independent audit**. That is a deliberate choice, disclosed everywhere rather than hidden: the beta banner, the age and jurisdiction check before first use, the FAQ and the \$REEF page all say the contracts are unaudited and to use only what you can afford to lose.

Why it is reasonable to test

- Core exchange logic is a close copy of Uniswap V2, one of the most battle-tested designs in DeFi
- All known issues found in review have been fixed; Slither found nothing real
- No admin can freeze or take user funds; the presale has no owner and a refund fallback

What remains a risk

- No professional audit; a bug could still cost users money
- Three core contracts cannot show verified source on the explorer
- A young chain with thin pools and occasionally unreliable RPCs

For testers

Now until Wed Oct 7, 2026, 09:00 (UTC+7).

What to test

Use small amounts only, on chain 1404 (community RPC), with MetaMask or a similar wallet.

- 1 Reef DEX** (reefdex.fyi): connect and switch to chain 1404; swap BDAG for a token and back; add liquidity, then remove part of it.
- 2 Create a pool** for a test token you deploy, and make a large swap to check the price-impact warning.
- 3 RPC panel and explorer**: switch endpoints; open a transaction link and confirm it lands on the explorer.
- 4 Phone and desktop**: use the site on both.
- 5 \$REEF page** (private preview link, sent separately; please don't share it or post about \$REEF before the Oct 6 announcement): tell us anything wrong, unclear, or not matching the contracts.

When reporting, include what you did, what you expected, what happened, your wallet and browser, a screenshot, and the transaction hash if there is one.

Rewards: 210,000 REEF by points

Core run-through completed (once)	10 pts
Bug that could lose funds or break a transaction	50 pts
Something that doesn't work	15 pts
Wrong or misleading information	10 pts
Confusing wording or layout (incl. mobile)	3 pts

First reporter only for duplicates. Share = your points ÷ all points × 210,000, capped at 21,000 REEF per tester. Points are frozen at Oct 7, 09:00 and the table is shared for checking. Payout wallets are confirmed by signed message.

Paid only after the \$REEF pool launches (from Nov 6). Testing before Oct 7 does not count toward the public airdrop. Testers must be 18+ and not US or UK persons; rewards may count as income where you live.

Known limitations. BlockDAG is a young chain, and public RPC endpoints sometimes lag or go offline. Most pools have little liquidity, so trades can move prices a lot. Pools can be created for any token, including fake ones — always check the contract address. Token approvals are for the exact amount, so you approve again on each new trade (safer, one extra click).

- 1

Invite-only testing — Sep 30 to Oct 7, 09:00. Small group, low-value funds; bugs and usability issues gathered and fixed.
- 2

Public beta and \$REEF sale — Oct 7 to Nov 6. Site open to everyone as a disclosed, unaudited beta; presale and airdrop window run; weekly public updates.
- 3

Launch and settlement — from Nov 6. `finalize()` opens the REEF/BDAG pool at 225; buyers claim; airdrop snapshot published and claims open (close Feb 4, 2027); tester rewards paid.
- 4

Security hardening — date open. Independent audit of the Reef and \$REEF contracts with the report published; a bug-bounty programme.
- 5

Growth. Invite token projects to create pools, more oracle-tracked pairs, and wider governance over the fee switch (the 0.05% protocol fee is already on and funds the treasury).

Open question for the team: target date and budget for the independent audit.
